

Jaccard coefficient

Name	Gender	Fever	Cough	Test-1	Test-2	Test-3	Test-4
Jack	M	Y	N	P	N	N	A
Mary	F	Y	N	P	A	P	N
Jim	M	Y	P	N	N	N	A

Convert this into:

Jack	M	1	0	1	0	0	0
Mary	F	1	0	1	0	1	0
Jim	M	1	1	0	0	0	0

Jaccard = overlapping 1s / total 1s

Jaccard(Jack, Mary) = 2 / 3 = 0.67

Jaccard(Jack, Jim) = 1 / 3 = 0.33

Jaccard(Jim, Mary) = 1 / 4 = 0.25

I used the common approach to Jaccard coefficient, that is calculating the size of the intersection divided by the size of the union of the sample sets.

The modul's solution used the symmetric difference of the compared sets, which is the complement set of the intersection. That's why the results differ: 1 - this solution = modul solution.
